Notes

- One repo, multiple projects.
- `protocol/` is shared contract source-of-truth.
- `agent/` owns SDR access, FFT generation, buffering, outbound connection.
- `server/` owns auth validation, session management, frame validation, fanout.
- `web/` is the remote live viewing UI.
- Tests live inside each project, not in one giant repo-level test folder.
- Add repo-level `e2e/` only when you actually need cross-project end-to-end tests.
